Technical Assessment

Build an AI Agent for Monitoring the London Office Market

Business Context Your business team requires regular, reliable monitoring of the London office commercial real estate (CRE) market. Key areas of interest include trends in prime and Grade A office rents, vacancy/availability rates, leasing take-up/activity, supply pipelines (new developments, refurbishments, pre-lets), submarket dynamics (e.g., City, West End, Canary Wharf, Midtown/Fringe), macroeconomic influences (interest rates, economic indicators, employment), occupier demand drivers (e.g., flight-to-quality, ESG/sustainability preferences, hybrid working impacts), and emerging news or events affecting the sector. The aim is to enable the team to stay ahead of market shifts, spot risks/opportunities early, and support informed decision-making, reporting, or strategy discussions — replacing or augmenting manual research and static reports.

Your Task Design and deliver **an AI agent** with Python code that assists the business team in monitoring the London office market. You are free to define the precise scope. You are suggested to architect the AI agent with skills.

Required Deliverables Submit:

1. **A testable AI agent PoC** (with Python code) that we can run and interact with.
2. **A few slides (3–6 maximum)** Prepare the slides as if you are explaining your AI agent directly to the business team
